

GAIN EFFICIENCIES IN THE MANAGEMENT OF PROTOCOLS, CONTACTS & PATIENTS BY INTEGRATING YOUR CTMS WITH VESTIGO

Sync your Data and Keep it Up-to-Date

- The interface pulls data at regular intervals to update Vestigo with any new or changed information. Users can also select to update at any time.
- The interface updates protocols, staff, and patient/subject information.
- A CTMS alert provides notification of new enrollments and any changes to enrollment status. Changes to patient demographic information are also queued up within the Vestigo patient profile.
- Vestigo currently interfaces with OnCore and Clinical Conductor. If your organization uses a different CTMS or IRB system with an available API, please ask our team about a potential interface.

Increase Efficiency at Every Step in the Protocol Management Process

- **Increase Efficiency** by loading protocol information/contacts directly from the CTMS.
- **Improve Compliance** with accurate prescriber and contact information.
- **Improve Safety** as patient information is transferred from the CTMS, reducing manual data entry and maintaining one source of truth.
- **Enhance Patient Care** with seamless enrollment from an alert and improve overall inventory management with accurate patient status updates.
